The station consists of 12 flywheel energy storage arrays composed of 120 flywheel energy storage units, which will be connected to the Shanxi power grid. The project will receive dispatch instructions from the grid and perform high-frequency charge and discharge operations, providing power ancillary services such as grid active power balance.

What is a flywheel/kinetic energy storage system (fess)?

A flywheel/kinetic energy storage system (FESS) is a type of energy storage system that uses a spinning rotor to store energy. Thanks to its unique advantages such as long life cycles, high power density, minimal environmental impact, and high power quality such as fast response and voltage stability, FESS is gaining attention recently.

Can flywheel energy storage systems support microgrid frequency control?

For this reason, such off-grid microgrid employs storage systems and diesel generators to provide some flexibility. Flywheel energy storage systems (FESSs) have very quick reaction time and can provide frequency support in case of deviations. To this end, this paper develops and presents a microgrid frequency control system with FESS.

Are flywheels a good choice for electric grid regulation?

Flywheel Energy Storage Systems (FESS) are a good candidate for electrical grid regulation. They can improve distribution efficiency and smooth power output from renewable energy sources like wind/solar farms. Additionally, flywheels have the least environmental impact amongst energy storage technologies, as they contain no chemicals.

Are flywheel-based hybrid energy storage systems based on compressed air energy storage?

While many papers compare different ESS technologies, only a few research studies design and control flywheel-based hybrid energy storage systems. Recently, Zhang et al. present a hybrid energy storage system based on compressed air energy storage and FESS.
