What is thermal energy storage (TES)?

Thermal energy storage (TES) is a technology that stocks thermal energy by heating or cooling a storage medium so that the stored energy can be used at a later time for heating and cooling applications and power generation. TES systems are used particularly in buildings and in industrial processes.

Why do we need thermal storage facilities?

Thermal storage facilities ensure a heat reservoir for optimally tackling dynamic characteristics of district heating systems: heat and electricity demand evolution, changes of energy prices, intermittent nature of renewable sources, extreme wear conditions, malfunctions in the systems.

Thermal energy storage deals with the storage of energy by cooling, heating, melting, solidifying a material; the thermal energy becomes available when the process is reversed [5]. Thermal energy storage using phase change materials have been a main topic in research since 2000, but although the data is quantitatively enormous.

Thermal energy in the form of chilled water or heated water is produced during the off-peak times of less electrical demand. This chilled or heated water is collected in a thermal energy storage tank, and is then withdrawn and distributed to the facility during the peak heating or cooling periods.
