A German physicist, Hermann von Helmholtz, first described [1] the concept of the double-layer capacitance in 1853. General Electric Company in 1957, first patented [3] EC based on the double-layer capacitance structure. This capacitor consisted of porous carbon electrodes using the double-layer capacitance mechanism for charging.

battery can store more total energy than a capacitor, but it cannot deliver it very quickly, which means its power density is low. Capacitors, on the other hand, store relatively less energy per unit mass or volume, but what electrical energy they do store can be discharged rapidly to produce a lot of power, so their power density is usually high.
