

How does a modified SEI layer improve electrochemical properties?

By comparison, the components of the modified SEI layer consist of rich-LiF and Li-Ag alloys, which not only availablely restrain side reactions, but also enable the homogeneous Li⁺ ions flux with free of lithium dendrite, thus resulting in improved electrochemical properties. Fig. 4.

Why is the cathodic interface complex?

The cathodic interface is complex due to low electronic conductivity, poor contact, and electrochemical instability. Firstly, it causes changes in the volume of the cathode electrodes.

Can interface modification improve electrochemical compatibility between cathode and OSE?

At present, many effective solutions have been proposed to solve these problems, and the interface modification of the inorganic buffer layer, inorganic coating, polymer buffer layer, etc. is considered to be a promising strategy to inhibit the interdiffusion of elements and improve the electrochemical compatibility between cathode and OSEs.

How can OSEs/electrode interfaces be optimized?

To address the challenges of poor solid contact, stress failure, and interfacial side reactions, strategies to optimize the OSEs/electrode interface include interfacial wetting agents, the introduction of an interfacial buffer layer, and the construction of a structured electrode by constructing a 3D porous skeleton. 4.1. Interfacial modification

What are the adsorption energies between TFSI and other electrolyte components?

The adsorption energies between TFSI - and other electrolyte components are further estimated by density functional theory (DFT). As exhibited in Fig. 2g, TFSI - mainly interacts with hydrogen atoms in PEO and the adsorption energies is 0.29 eV.

Why is multi-scale characterization important in battery Interphase Engineering?

The ability to correlate these properties with electrolyte composition and cycling performance underscores the importance of multi-scale characterization in understanding and optimizing battery interphases. These results open exciting opportunities for both experimental and theoretical advancements in interphase engineering.

Charge migration and drift formed by piezoelectric and pyroelectricity are stored into BiO(IO₃)_{1-x-y}(I₃)_xI_y and BiOBr crystals, storing 91.55 and 127.08 $\mu\text{mol}\cdot\text{g}^{-1}$ of electrons ...

Optimization and progress of interface construction of ceramic oxide solid-state electrolytes in Li-metal batteries. Author links open overlay ... Li metal is deemed the most promising anode material for next-generation energy storage devices on account of its high specific capacity (3860 mAh g⁻¹) as well as low electrochemical potential ...

The low permeability of salt rock makes it a widely recognized and preferred energy storage medium in international oil and gas storage development (Liu et al., 2024; Wan et al., 2023a).The ...

The unique coupling-interface hybrid structure is conducive to improving the stability and rate performance of the MoS₂@NG electrode. It is worth noting that the nitrogen doping and coupling-interface in the composite can significantly enhance the adsorption property of sodium on MoS₂ and effectively improve its sodium storage performance.

2 Chongqing Institute of New Energy Storage Materials and Equipment Chongqing China. ... Our comprehensive analysis establishes fundamental correlations between interface architecture ...

The construction and the principle of suppressing lithium dendrites of the LGC layer: (a) Cl 2p, (b) Ga 3d and (c) Li 1 s XPS spectra and their fitting curves of the LGC layer. AFM images and corresponding Young's modulus mapping: (d, e) Pristine Li, (f, g) LGC-Li anode. ... DFT calculation results between the interface energy and the number ...

With the rapid development of portable electronic devices and the electric vehicle industry, the demand for energy storage systems in terms of energy density and safety has dramatically ...

In situ construction of organic anion-enriched interface achieves ultra-long life aqueous zinc-ion battery. Author links open overlay panel Qiulong Guan a, Jianghuan Li a, Lijie Li b, ... Energy Storage Mater., 49 (2022), pp. 463-470, 10.1016/j.ensm.2022.04.018.

Next-generation energy storage methods are closely related to green recovery in the post-pandemic period and the future energy structure. Advanced graphene-based freestanding electrodes with highly tunable electronic structures and mechanical stability present superior electrochemical performance, which are among the most promising candidates for ...

Interface engineering represents a transformative strategy that integrates precise architectural control with strategic compositional design in magnesium-based hydrogen storage systems. While interface architecture through structural ...

Numerous studies have shown that utilizing new materials to construct different interfaces represents one of the crucial methods for addressing these challenges. 11, 20 ...

On the contrary, in-situ construction of a ZnF₂-based SEI through electrolyte modulation is more facile and therefore more attractive. For instance, in a water-in-salt (WIS) electrolyte composed of 1 m Zn(TFSI)₂ + 20 m LiTFSI (m: mol kg⁻¹), a Zn²⁺ ion-conductive and water-blocking fluorinated SEI layer was in-situ formed on the Zn surface due to the ...

Energy Storage Materials. Volume 46, April 2022, Pages 68-75. Smart construction of multifunctional Li 1.5

Al_{0.5}Ge_{1.5} ... Li interfaces. Such smart construction of multifunctional interfaces allows the superior electrochemical performance in Z-LAGP based Li metal batteries. ...

Construction of energy storage heterojunction and enhancement mechanism of dark and full-spectrum energy storage piezoelectric catalysis *Chemical Engineering Journal* (IF 13.3) Pub Date : 2024-12-28, DOI: 10.1016/j.cej.2024.159066

Energy storage technology is a key for a clean and sustainable energy supply. but their energy density is restricted by surface charge storage. ... which hinders the uniform diffusion of precursors in subsequent ALD for MIM capacitor construction. Therefore, a buffer ... ALD/ALD interface optimisation and the application of high breakdown field ...

AZIBs are regarded as promising large-scale energy storage candidates because of their environmental benignity, abundant availability on earth, low electrochemical potential (-0.76 V vs standard hydrogen electrode) and high theoretical capacity (820 mAh g⁻¹) [[1], [2]]. Unfortunately, side reactions and dendrites are inevitable when using conventional liquid ...

The formation of the built-in electric field at the interface enhanced the polarization electric field of the energy storage heterojunction, and its piezoelectric d_{33} value increased to 3.68 nm³V⁻¹, storing mechanical energy in the energy storage heterojunction crystals through the enhanced polarization electric field. The degradation ...

Constructing mutual-philic electrode/non-liquid electrolyte interfaces in electrochemical energy storage systems: Reasons, progress, and perspectives. Author links open overlay panel Lei Zhao, Yuanyou Peng, Fen ... three fundamental issues should be addressed in the construction of a favorably mutual-philic interface between electrode and non ...

Due to their high power density, rapid charging/discharging ability, and excellent cycling stability, supercapacitors have long been viewed as vital electrochemical energy storage devices [77]. In general, supercapacitors can be divided into pseudocapacitors and electric double-layer capacitors, according to their energy storage mechanism.

Solid-state lithium metal batteries (SSLMBs) with ultra-high energy density and excellent safety features are considered ideal candidates for next-generation energy storage devices. Solid-state electrolytes (SSEs) as critical materials for SSLMBs include oxide-type, ...

Sodium-ion batteries (SIBs) are emerging as a highly promising next-generation energy storage solution, driven by the abundance of sodium and chemical similarities to ...

Sodium ion batteries (SIBs) are considered as promising alternative to lithium ion batteries (LIBs) in large-scale and low-cost energy storage systems, due to the earth abundance and extensive distribution of

sodium resource [1], [2], [3] recent years, sodium metal anode has attracted significant interest for high energy density SIBs because of its high specific capacity ...

Metal selenides have attracted increased attention as promising electrode materials for electrochemical energy storage and conversion systems including metal-ion batteries and water splitting. However, their practical ...

Interphases at the electrode-electrolyte interface are fundamental to the operation and longevity of electrochemical energy storage systems. 1 These layers, including the solid electrolyte interphase (SEI) on the anode and ...

The nanosheets offered an enlarged electrically active surface area, and the nanowires provided support for the nanosheets, thereby forming a heterojunction interface. ...

As an emerging energy storage material, phosphorus has been attracting extensive attentions in recent years due to its fascinating electrochemical properties and favorable thermal stability. ... According to the ...

1 Introduction. Hydrogen as a versatile energy carrier is considered as a key component for developing the decarbonization strategy of energy storage, power generation, and chemical industry. [] The safe and ...

The interface reconstruction algorithm typically assumes that the interface within the grid is planar ... A simulation method for the dissolution construction of salt cavern energy storage with the interface angle considered. Energy, 263 (2023), Article 125792. View PDF View article View in Scopus Google Scholar

With the progress of science, technology, and human society, issues such as environmental pollution, the energy crisis, and global climate change are progressively exacerbating [1].Therefore, it is crucial to enhance energy utilization efficiency [2] and to design dielectric capacitors with high energy storage performance [3].Currently, lead-free dielectric ...

Synergized Interface Engineering and Alloying Strategy for In Situ Construction of a Three-Dimensional Lithiophilic Carbon Skeleton: Motivating High-Performance Lithium Metal ...

The construction parameters, which include the depth of the water injection tube/brine discharge tube/blanket pad, the dissolution duration, and the flow rate, regulate the flow and concentration field of the water brine within the cavern. ... A simulation method for the dissolution construction of salt cavern energy storage with the interface ...

Optimization and progress of interface construction of ceramic oxide solid-state electrolytes in Li-metal batteries Energy Storage Materials (IF 18.9) Pub Date : 2024-06-22, DOI: 10.1016/j.ensm.2024.103589
