The converter can be utilized as the charging regulator for batteries/super-capacitors in the hybrid energy systems.

Which capacitors are charged and discharged during a switching state?

The capacitors  $C_4$  and  $C_5$  are both charged, whereas  $C_3$  is discharged to power the load. Based on the above operating analysis, the voltages across components during each switching states can be obtained by applying Kirchhoff's voltage laws as follows.
