

Hydrogen, globally recognized as the most efficient and clean energy carrier, holds the potential to transform future energy systems through its use a...

During storage and transportation of high-pressure hydrogen, external impacts can cause invisible damage to composite hydrogen storage cylinders, significantly reducing their residual burst pressure (RBP). The impact resistance of metal lined Type III cylinders and plastic lined Type IV cylinders varies due to differences in design and materials.

11. Physical impact from parts of gas cylinders that fail or any flying debris resulting from a cylinder or pipework failure. Impact from falling cylinders 12. Impact from falling cylinders may occur during transit or during storage if not properly secured. Exposure to a released gas 13.

Hydrogen storage cylinder is an important component in high-pressure gaseous hydrogen (HPGH 2) storage system, and plays a key role in hydrogen-powered transportation including land vehicles, ships and aircrafts. Over the past decade, the number of hydrogen fuel cell vehicles (HFCVs) has rapidly increased worldwide. ... helium leak-detection ...

Topics: Acoustic emissions, Composite materials, Cylinders, Gas cylinders, Signals, Damage, Pressure, Energy levels (Quantum mechanics), Renewable energy, Safety Artificial Intelligence for the Output Processing of Phased-Array Ultrasonic Test Applied to Materials Defects Detection in the ITER Vacuum Vessel Welding Operations

The plastic liner of the IV type hydrogen storage cylinders was made of multiple segments using laser welding technology, with a small diameter and wall thickness, making it ...

However, there is no special cylinder detection probe now. In this paper, a probe of ultrasonic guided wave excitation generator is designed for vehicle-mounted winding hydrogen storage cylinders. The research results of this paper are of great significance for the safety of hydrogen storage tanks in new energy vehicles.

Hydrogen cylinders have an outlet connection that is specific for flammable gas cylinders. In the United States, this is a CGA 350 connection with a left-handed thread. The safety pressure relief device on a

hydrogen cylinder ...

The composite shell of composite high pressure hydrogen storage vessel (CHPHSV) is the main structure in bearing inner pressure. Its failure will lead to leakage or burst of CHPHSV, which will cause serious safety problem ...

Industrial computed tomography is able to intuitively display three-dimensional information of the examined object, and thus this technology is expected to detect internal ...

Aiming at the problems of difficulty and low detection accuracy in manual detection of scratches on the inner surface of ultra-long energy storage gas cylinders in the aerospace industry, a detection system for scratches on the inner surface of ultra-long gas cylinders based on VGG-16 neural network is designed. In this paper, VGG-16 recognition ...

In this context, hydrogen has emerged as a particularly promising energy vector for electricity and heat generation, contributing to the transition toward clean energy solutions. ... the refueling of high-pressure hydrogen tanks can lead to a rapid increase in the internal temperature of the storage cylinder, potentially causing a decrease in ...

in-depth research on high-pressure gaseous energy storage systems and establish an evaluation model based on fuzzy analytic hierarchy process, which includes four dimensions: technology, ...

Hydrogen energy storage system is a solution for the consumption of new energy and the construction of a new distribution system. This paper proposes a comprehensive ...

holding space is provided to place the gas cylinder. During the detection process, the air in the holding space is discharged through the vacuum tube, so that there is no external factor affecting the detection value in the detection process, which can effectively solve the problems existing in the existing technology. 3. Experiments and results

In this paper, a carbon fiber fully wound plastic liner hydrogen storage cylinder (type IV cylinder) was modeled by software. Then the model was subjected to drop simulation, and by changing the drop height, the drop angle and the residual pressure inside the cylinder, the curve and the cloud diagram of the maximum total stress over time as well as the cloud ...

This paper proposes a phased array detection technology utilizing a concave acoustic lens that combined water-immersion to focus ultrasound in the radial direction of the steel cylinder. The ...

With the increasing demand for hydrogen energy, there is a growing requirement for regular detection and SHM of the composite hydrogen storage vessel. To guarantee the reliability of the high-pressure composite hydrogen storage vessels in service, it is important to evaluate the real-time safety situation of composite

vessels.

The test hydrogen gas cylinder is a high-pressure hydrogen storage cylinder for type I II vehicles working pressure of 35Mpa, DN406mm× 540mm, a wall thickness of 5mm, and a material of 30CrMo steel.

Plenty of delamination defects were found in composite hydrogen storage cylinders. Shearography measurement captured "butterfly-shaped" fringes in cylinder surfaces. Such fringes represent the anomalous responses from delamination defects. The anomalies can be ...

Abstract: Aiming at the problems of difficulty and low detection accuracy in manual detection of scratches on the inner surface of ultra-long energy storage gas cylinders in the aerospace industry, a detection system for scratches on the inner surface of ultra-long gas cylinders based on VGG-16 neural network is designed. In this paper, VGG-16 ...

However, there is no special cylinder detection probe now. In this paper, a probe of ultrasonic guided wave excitation generator is designed for vehicle-mounted winding hydrogen ...

Gas cylinder detection and the identification of their characteristics hold considerable potential for enhancing safety and operational efficiency in several applications, including industrial and warehouse operations. These tasks gain significance with the growth of online trade, emerging as critical instruments to combat environmental crimes associated with ...

Liquidifying hydrogen is an expensive and time-consuming process. The energy loss during this process is about 40%, while the energy loss in compressed H₂ storage is approximately 10% (Barthelemy et al., 2017). Besides, a proportion of stored liquid hydrogen is lost (about 0.2% in large and 2-3% in smaller containers daily), which is due to ...

Carbon fiber-reinforced composite hydrogen storage cylinder is a key component used in hydrogen fuel cell electric vehicles. However, some micro defects such as voids and ...

The cylinder body of the IV type hydrogen storage cylinder, except for the metal valve seat, is all made of non-metallic composite materials. Due to the fact that the IV type cylinder body is all resin and easy to shape, its external ...

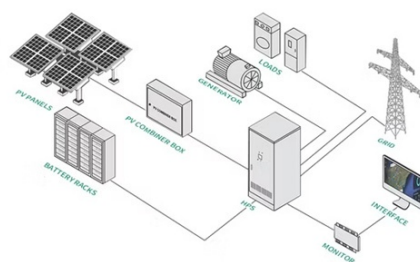

Hydrogen has the highest energy content per unit mass (120 MJ/kg H₂), but its volumetric energy density is quite low owing to its extremely low density at ordinary temperature and pressure conditions. At standard atmospheric pressure and 25 °C, under ideal gas conditions, the density of hydrogen is only 0.0824 kg/m³ where the air density under the same conditions ...

Here, we conducted defect detection and wall thickness analysis by industrial computed tomography on the hydrogen storage cylinder for unmanned aerial vehicles and found that the ...

Hydrogen energy storage systems are expected to play a key role in supporting the net zero energy transition. Although the storage and utilization of hydrogen poses critical risks, current hydrogen energy storage system designs are primarily driven by cost considerations to achieve economic benefits without safety considerations.

Hydrogen energy storage system is a solution for the consumption of new energy and the construction of a new distribution system. This paper proposes a comprehensive evaluation method for high ...
