The studies of capacity allocation for energy storage is mostly focused on traditional energy storage methods instead of hydrogen energy storage or electric hydrogen hybrid energy storage. At the same time, the uncertainty of new energy output is rarely considered when studying the optimization and configuration of microgrid.

This accelerates the aging of the polymers, severely impacts their electrical insulating performance, and further diminishes energy storage properties and service life of the polymers. Therefore, to effectively mitigate the conduction losses is crucial for designing dielectrics with excellent high-temperature energy storage capabilities.
