

What is the difference between battery duration and energy capacity?

The duration of a battery is the length of time that a storage system can sustain power output at its maximum discharge rate, typically expressed in hours. The energy capacity of the battery storage system is defined as the total amount of energy that can be stored or discharged by the battery storage system.

How long does an energy storage system last?

While energy storage technologies are often defined in terms of duration (i.e., a four-hour battery), a system's duration varies at the rate at which it is discharged. A system rated at 1 MW/4 MWh, for example, may only last for four hours or fewer when discharged at its maximum power rating.

How long can a battery energy storage system deliver?

How long the battery energy storage systems (BESS) can deliver, however, often depends on how it's being used. A new released by the U.S. Energy Information Administration indicates that approximately 60 percent of installed and operational BESS capacity is being exerted on grid services.

What is the duration of a battery?

From this perspective, duration has a fairly straightforward definition summarized by the U.S. Energy Information Administration (2): The duration of a battery is the length of time that a storage system can sustain power output at its maximum discharge rate, typically expressed in hours.

How long does a battery storage system last?

For instance, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity can provide power for four hours. The cycle life/lifetime of a battery storage system determines how long it can provide regular charging and discharging before failure or significant degradation.

What is storage duration?

Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity. For instance, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours.
