How can energy storage systems help the transition to a new energy-saving system?

Innovative solutions play an essential role in supporting the transition to a new energy-saving system by expanding energy storage systems. The growth and development of energy storage systems should be central to planning infrastructure, public transport, new homes, and job creation.

Does the Energy Management System (EMS) deserve further research?

The energy management system (EMS) also deserves further research, including the improvement based on the MHC proposed in this paper (Considering the power station's structure, the unit's capacity, and the system's operating status, etc.) and the research of new control technology.

Changing power delivery trends, as well as demand side management, can both be achieved based on the energy storage systems being used. A thorough analysis into the studies and research of energy storage system diversity-based on physical constraints and ecological characteristics will influence the development of energy storage systems immensely.
