

What is the discharge capacity of a flat plateau?

Such a flat plateau roots in a single-phase transition between Bi_2O_3 and Bi. Based on this phase-transition controlled electrochemical process, excellent rate capability is expressed, the discharge capacity at 0.1 A g^{-1} and 20 A g^{-1} ($\sim 61^\circ\text{C}$) achieves 323 mAh g^{-1} and 155 mAh g^{-1} , respectively.

Which multi-tube LHS has the highest energy storage/release capacity?

Multi-tube LHS with various geometries using metal foam-enhanced PCM is analyzed. The triangular tube achieved the highest reduction in charge time at 10.4 %. The square tube achieved the highest reduction in discharge time at 27.8 %. The triple triangle tube provided the greatest energy storage/release capacities.

What is the lowest discharge time for a square inner tube?

The lowest discharge times for all designs were obtained for the square inner tube geometry. The 100 % solidification rate time for the square inner tube was 10,040 s, 3900 s, 3060 s, and 1440 s for single-, double-, triple- and quadruple-tube designs, respectively.

How does a triangular tube improve energy storage/release capacity?

Energy storage/release capacity improved by 0.15 % to 12 % with the triangular tube. Phase change materials (PCMs) play a critical role in energy storage systems due to their high latent heat capacity, enabling efficient thermal energy storage and release during phase transitions.

Does a multi-tube LHS method affect charge/discharge time and energy storage/release capacity?

Studies on the multi-tube LHS method have focused on tube size, number, geometry, and layout. However, studies that collectively address the effects of tube geometry, size, number, and layout on charge/discharge time and energy storage/release capacity are not yet available in the literature.

Is the discharging plateau ultra-flat?

Remarkably, the discharging plateau maintained ultra-flat subjected to different discharging current densities at range from 0.5 to 3 A g^{-1} (Fig. 4 c).

The 200C discharge rate is demonstrated by the Powency(TM) 150 microampere-hours (mAh) model with an 18 mm² footprint, translating into peak current capabilities of 30 ...
