Owing to the outstanding energy storage performance of the Cu<sub>2</sub>O/MXene-B electrode, the as-prepared flexible device exhibited excellent energy density, as shown in Fig. 6. The Ragone plot shows the comparison of power and energy densities between the Cu<sub>2</sub>O/MXene-B device and previously reported MXene-based supercapacitors.

For the practical use, SSEs require a Li<sup>+</sup> conductivity higher than 10<sup>-4</sup> S cm<sup>-1</sup> [41]. Among various SSEs [42], [43], [44], several SSEs of a hygroscopic nature can only be fabricated in an inert atmosphere, which has been an obvious barrier for mass production, while the poor chemical stability of these SSEs toward Li metal anode and oxide cathodes further ...
