

Are inductor and capacitor a passive device?

Inductors and capacitors are energy storage devices, which means energy can be stored in them. But they cannot generate energy, so these are passive devices. The inductor stores energy in its magnetic field; the capacitor stores energy in its electric field.

What is the difference between a capacitor and an inductor?

The energy of a capacitor is stored within the electric field between two conducting plates while the energy of an inductor is stored within the magnetic field of a conducting coil. Both elements can be charged (i.e., the stored energy is increased) or discharged (i.e., the stored energy is decreased).

Why is energy stored in a capacitor?

Eugene Sh. It might be more helpful to visualize the energy in a capacitor as being stored in the electric field between the plates. This electric field arises because of the displacement of the charge from one plate to the other. If it weren't for this field, it wouldn't have required any energy to shift the charges in the first place.

How are energy storage mechanisms represented in electric circuits?

These two distinct energy storage mechanisms are represented in electric circuits by two ideal circuit elements: the ideal capacitor and the ideal inductor, which approximate the behavior of actual discrete capacitors and inductors. They also approximate the bulk properties of capacitance and inductance that are present in any physical system.

What happens if a capacitor is charged or discharged?

Both elements can be charged (i.e., the stored energy is increased) or discharged (i.e., the stored energy is decreased). Ideal capacitors and inductors can store energy indefinitely; however, in practice, discrete capacitors and inductors exhibit "leakage," which typically results in a gradual reduction in the stored energy over time.

Use of capacitors for energy storage in circuits. Capacitors store energy in electrical circuits. They collect and hold electric charge. This process allows them to release energy quickly when needed. Devices like flash cameras use capacitors for rapid discharge of stored energy, creating bright flashes in an instant.
