

Is indirect liquid cooling a viable solution for cabinet power density reduction?

Indirect liquid cooling is currently the main cooling method for the cabinet power density of 20 to 50 kW per cabinet. An integrated energy storage batteries (ESB) and waste heat-driven cooling/power generation system was proposed in this study for energy saving and operating cost reduction.

What is liquid air energy storage?

Liquid air energy storage manages electrical energy in liquid form, exploiting peak-valley price differences for arbitrage, load regulation, and cost reduction. It also serves as an emergency power supply, enhancing the reliability of electricity supply to the consumer.

What are the benefits of a liquid air energy storage system?

The only benefit that is reflected in the financial income calculation is the energy conversion income of the energy storage system. In accordance with the financial evaluation model of the energy storage system, each financial income index of the liquid air energy storage system can be ascertained.

What is the total energy consumption of a liquid cooling data center?

The total energy consumption includes the energy consumptions of the cabinets, uninterruptible power supply (UPS), cooling system, lighting system, power transfer, and distribution system. The PUE of the liquid cooling data centers can usually be reduced to below 1.3 [6, 7].

What is liquefied air energy storage system?

The operation of the liquefied air energy storage system consists of five units: compression and purification, liquefaction, heat storage, cold storage, and turbine power generation. The heat storage unit is divided into heat storage and heat release stages, and the cold storage unit is divided into cold storage and cooling release stages.

Can integrated energy storage batteries and waste heat-driven cooling/power generation save energy?

An integrated energy storage batteries (ESB) and waste heat-driven cooling/power generation system was proposed in this study for energy saving and operating cost reduction. Energy, economic and environmental analyses were carefully carried out for a data center in Shenzhen.

Additionally, their intelligent management system is a key factor in achieving efficient energy storage. This system can monitor and analyze various parameters during the storage process in real-time, accurately regulating the operation of the liquid cooling system and storage units to achieve the best storage effect.

Compared with air cooling, liquid cooling is more efficient due to higher heat transfer coefficient of water [68]. Liquid cooling can be classified into direct cooling and indirect cooling. Direct cooling (such as liquid immersion cooling) can cool the entire battery surface, which greatly contributes to the temperature uniformity of LIBs.

Indirect liquid cooling is a heat dissipation process where the heat sources and liquid coolants contact indirectly. Water-cooled plates are usually welded or coated through thermal conductive silicone grease with the chip packaging shell, thereby taking away the heat generated by the chip through the circulated coolant [5].
