What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

What type of energy is stored in a flywheel?

The principle of rotating mass causes energy to store in a flywheel by converting electrical energy into mechanical energy in the form of rotational kinetic energy.

How long does a flywheel energy storage system last?

Flywheel energy storage systems have a long working life if periodically maintained (>25 years). The cycle numbers of flywheel energy storage systems are very high (>100,000). In addition, this storage technology is not affected by weather and climatic conditions. One of the most important issues of flywheel energy storage systems is safety.

Which method is used in flywheel energy storage system?

Another method used in flywheel energy storage systems is to store energy with high speed. In this method the rotating object is rotated up to 100,000 rpm. The rotating object weight is low in this method. This method is used in small applications in terms of volume and weight.
