

Energy storage spot welding machine is dangerous

Are spot welding machines safe?

While spot welding machines are widely used in sheet metal shop and are generally safe machines, several safety concerns should be considered. These safety concerns include: The creation of strong electromagnetic fields. While spot welders are safe to use, there are several precautions operators should embrace.

Are air-operated resistance spot welding machines dangerous?

Just like a loaded gun, an air-operated resistance spot welding machine can be dangerous without properly trained operators who take appropriate safety precautions. Depending on the material thicknesses being welded, achieving a good spot weld requires forging forces from several hundred to several thousand pounds.

Can a foot-operated spot welder be dangerous?

The "pinch point" between the welding tips can be potentially dangerous. Although still available today, foot-operated spot welders have significant limitations because they cannot produce the high forging force required to produce strong and attractive welds in anything thicker than very light-gauge sheet metal.

What happens if a spot welder fails?

Without these safety devices installed in this type of welder, failure of the transformer could cause line voltage to pass through the operator to ground. A very strong electromagnetic field is created between the arms of a spot welder when the current flows while making welds.

Can a portable spot welder be used with a transformer?

Grounding is also critically important when welding with a hand-moved portable spot welding gun that has a built-in transformer. This type of portable spot welder should not be used unless it is equipped with a ground fault device and a ground confirmation system to protect the operator.

Do You need safety glasses for spot welding?

Require anyone who works in or travels through the spot welding department to wear safety glasses with side shields at all times. If possible, have the operator hold the parts being welded with both hands while the assembly is manipulated in the throat of the machine to access all weld locations.
