

Can energy bags be used for underwater compressed air storage?

Conclusions This paper has described the design and testing of three prototype Energy Bags: cable-reinforced fabric vessels used for underwater compressed air energy storage. Firstly, two 1.8 m diameter Energy Bags were installed in a tank of fresh water and cycled 425 times.

What is an energy bag?

An Energy Bag is a cable-reinforced fabric vessel that is anchored to the sea (or lake) bed at significant depths to be used for underwater compressed air energy storage. In 2011 and 2012, three prototype sub-scale Energy Bags have been tested underwater in the first such tests of their kind.

Could energy bags be used to store electricity underwater?

In the Bag: Energy bags like this 5-meter-diameter one, from Thin Red Line Aerospace, of Canada, could be used to store electricity underwater as compressed air. Engineers hope the technology could one day smooth out the intermittency of electricity produced by offshore wind farms and other renewable energy sources.

How do energy bags work?

Pictured here in a test tank Seamus Garvey's energy bags were designed and built by Thin Red Line Aerospace. The basic idea of CAES is that excess power on the grid is used in an electric motor to drive a compressor. The compressed air is cooled and stored at pressures of typically 60-70 bar.

How much energy does an energy bag store?

With regard to stored energy, an Energy Bag with height of 40 m and maximum diameter of 40 m (and a volume of 35,705 m³) would store 200 MWh if anchored at 500 m depth, assuming the most pessimistic expansion strategy was used.

Are energy bags ready for deployment?

However, as a result of the tests presented in this paper, Energy Bags are now well understood, well developed, and proven in real-world conditions, and are ready for deployment at larger scales within a pilot underwater compressed air energy storage plant.

Typically, compressed air energy storage (CAES) technology plays a significant role in the large-scale sustainable use of renewable energy [16]. However, the use of fossil fuels has resulted in comparatively low efficiency for conventional energy storage [17]. The advancement of traditional CAES technology is faced with important technical and engineering ...

Thermal energy storage (TES) tanks are specialized containers designed to store thermal energy in the form of chilled water. As water possesses excellent thermal transfer properties, it is an ideal medium for energy storage. ...

Flexible underwater storage vessels are also known as Energy Bags (see Figure 4). Within the Energy Bags there are small pressure differences, which is maximum at the top of the vessel ...

For large energy storage tanks characterized by lower heights and broader base areas, the natural stratification approach is impractical for cold storage. Therefore, a labyrinthine cold storage method is employed. ... Sun et al. [43] developed an innovative physically separated cold storage tank employing a flexible, bag-like layer to segregate ...

CAES, a long-duration energy storage technology, is a key technology that can eliminate the intermittence and fluctuation in renewable energy systems used for generating electric power, which is expected to accelerate renewable energy penetration [7], [11], [12], [13], [14]. The concept of CAES is derived from the gas-turbine cycle, in which the compressor ...

Kantharaj [113] proposed a new LAES system with a ground compressed air storage tank and a liquid air storage tank. During energy storage process, when the compressed air storage tank is about to be full, by converting an amount of compressed air to liquid air can still draw electrical energy from the grid. During energy release process, when ...

Thermal energy storage tanks take advantage of off-peak energy rates. Water is cooled during hours off-peak periods when there are lower energy rates. That water is then stored in the tank until it's used to cool facilities during peak ...

We perform a particular case study for a 1 GWh energy storage at 1000 m depth. The actual length depends basically on the tensile strength of the flexible fabric material. We select nylon and kevlar in order to model two extreme situations. The required length of the tubular bag lies in the interval between 1 km (Kevlar) and 15 km (nylon).
