

Tank thermal energy storage. Tank thermal energy storage (TTES) is a vertical thermal energy container using water as the storage medium. The container is generally made of reinforced concrete, plastic, or stainless steel (McKenna et al., 2019). The reason for this finding is that the two storage units (the tank and PCM unit) run alternately. Since the storage capacity of the tank is small and the heat transfer rate in the PCM unit is limited, the collector inlet temperature of the parallel system cannot be reduced effectively, and the collected energy cannot be improved obviously.

The exergy efficiency was however increased (from 85 to 89 %) by the insertion of PCM capsules. The lower energy efficiency of the storage tank with the PCM was compensated for by its higher thermal storage capacity which was between 3-7 % higher than that of the tank without the PCM. 4.2 Measures of performance based on exergy analysis
