How can energy storage reduce the investment in power transmission & distribution equipment?

Therefore, energy storage can store the energy during the peak periods of the renewable energy outputs and release it during the uncongested periods, which can also reduce the investment for power transmission and distribution equipment. Should a generator be a reverse energy protection device?

As a result, the generator will become a synchronous motor and will actually cause significant mechanical damage. The reverse energy protection device should be included in the generator protection scheme. Smart grids use communication networks with sophisticated algorithms to ensure coordination between protection systems.

What happens if reverse power is not considered in a protection system?
