Which EES systems are suitable for short and medium discharge times?

EES systems for short and medium discharge times cover wide ranges of rated power and energy density. Several mature EES technologies, in particular FES, DLC and battery systems, can be used in these ranges. PHS is the only currently feasible large-capacity EES for medium discharge times; further development in CAES is expected.

What is electrical energy storage (EES)?

Electrical Energy Storage, EES, is one of the key technologies in the areas covered by the IEC. EES techniques have shown unique capabilities in coping with some critical characteristics of electricity, for example hourly variations in demand and price.

What is the difference between fixing devices and supporting accessories/equipment?

Fixing devices are selected for their suitable ability for the environment, the load they are to support and substratum's into which they are to be installed. Supporting accessories/equipment is selected for suitability for the environment and ability to support and protect from damage that which they are intended to support.

Which EES technologies can be used in a large-capacity battery system?

Several mature EES technologies, in particular FES, DLC and battery systems, can be used in these ranges. PHS is the only currently feasible large-capacity EES for medium discharge times; further development in CAES is expected. Suitable locations for large PHS and CAES systems are topographically limited.
