What is electrochemical energy storage?

A general idea of electrochemical energy storage is shown in Figure 1. When the electrochemical energy system is connected to an external source (connect OB in Figure 1), it is charged by the source and a finite charge  $Q$  is stored. So the system converts the electric energy into the stored chemical energy in charging process.

What is an example of energy storage?

When the system is connected to an external resistive circuit (connect OA in Figure 1), it releases the finite  $Q$  and drives a current through the external circuit. The system converts the stored chemical energy into electric energy in discharging process. simple example of energy storage is capacitor.
