

What are graphite bipolar plates for fuel cells?

Our graphite bipolar plates for fuel cells are manufactured specifically for the PEMFC and DMFC types. Through many years of research and development work, we have succeeded in optimizing the outstanding material properties of our high-performance materials and enabling the production of high volumes.

How does a graphite plate function in a fuel cell?

In a fuel cell, the graphite plate functions as both a conductor to receive energy from the electrodes and as a bipolar plate to guide the flow of hydrogen and oxygen through their respective ends of the stack. This ensures that the maximum amount of gasses and moisture comes in contact with the membrane.
