The conservation of energy is a basic principle of physics--energy cannot be created nor destroyed. When something (such as a mass) is moving or rotating, it accumulates kinetic energy. In a motor system, that kinetic energy comes from a power source that provides electrical energy to a motor, which creates torque to accelerate the mass.

Kinetic energy recovery systems (KERSs), also called regenerative braking, are able to recover part of kinetic energy dissipated during braking and store the recovered energy for use when needed [2] mercially, a KERS contains two technological paths: mechanical KERS based on flywheels [3, 4] and electrical KERS based on a motor generator [5, 6]. ...
