The electricity generated by a home or business rooftop solar system may be: used to charge a battery if the system includes one. Solar can reduce your electricity bill through:

Will electricity storage capacity grow by 2030?

With growing demand for electricity storage from stationary and mobile applications, the total stock of electricity storage capacity in energy terms will need to grow from an estimated 4.67 terawatt-hours (TWh) in 2017 to 11.89-15.72 TWh (155-227% higher than in 2017) if the share of renewable energy in the energy system is to be doubled by 2030.

How can a solar battery save you money?

reduce curtailment (likely to be only a small saving). A battery can store energy generated by your solar system for later use, when the solar system is not generating electricity. This increases solar self-consumption and reduces the amount of electricity you need to buy from your electricity retailer.

Is electricity storage an economic solution?

Electricity storage is currently an economic solution of-grid in solar home systems and mini-grids where it can also increase the fraction of renewable energy in the system to as high as 100% (IRENA, 2016c). The same applies in the case of islands or other isolated grids that are reliant on diesel-fired electricity (IRENA, 2016a; IRENA, 2016d).

Why do we need electricity storage?

More directly, electricity storage makes possible a transport sector dominated by electric vehicles (EVs), enables effective, 24-hour of-grid solar home systems and supports 100% renewable mini-grids. As variable renewables grow to substantial levels, electricity systems will require greater flexibility.
