

How to calculate the economic inflection point of energy storage

How should energy storage be assessed?

Economic assessment of energy storage must be based on the lifetime cost of energy or power delivered, factoring in all parameters for technology cost, performance, and the service it provides.

What is a levelized cost of electricity storage?

Although useful and actively pursued, a generally accepted definition of a levelized cost of electricity storage, analog to the widespread used Levelized Cost of Electricity (LCOE), does not yet exist. Such a measure could allow for simple verification of the economic viability of certain storage technologies in a given electricity market.

What is the economics of energy storage?

Energy Storage Economics in a Nutshell: Energy storage is a system that moves energy from one time period to another. Decisions need to be made regarding: - When to fill the bucket (charge) - When to empty the bucket (discharge) - How big of a bucket (capacity) To consider: - How fast can the bucket be filled or emptied?

What determines the LCOE of a storage system?

For storage it is assumed that solely the cumulated stored energy determines the LCOE of the storage system. It turned out that C rate is the most important parameter for the LCOE of storage. In contrast, the efficiency plays a less dominant role as often assumed in current technology discussions.

Does energy storage add value to the electricity grid?

Behind the meter, at the distribution level, or at the transmission level. Energy storage deployed at all levels on the electricity system can add value to the grid. However, customer-sited, behind-the-meter energy storage can technically provide the largest number of services to the electricity grid at large (see Figure ES2)--even

Hantush (1964) described the properties of the inflection point at which general behavior of the curve starts to deviate from that of pure confined aquifer. Hantush (1960) observed the initial time-drawdown data fall on the Theis type curve for a period $t \leq t_i/4$ on the semilogarithmic paper. Herein, t_i is the time at which an inflection point occurs on the leaky aquifer type curve.
