Why does a PCM device have a high heat storage ratio?

The daily variation in heat release and storage ratio is caused by differences in daily building load. The original operation strategy did not take into consideration the heating load and heat release capacity of the PCM devices during heat storage, resulting in excessive heat storage.

In contrast, electric heating can include systems like electric radiators or an electric boiler. While electric systems boast nearly 100% efficiency, converting all electricity into heat, the higher kWh cost of electricity often results in higher running costs.
