What is pumped storage hydropower (PSH)?

Pumped storage hydropower (PSH) is a type of hydroelectric energy storage. It is a configuration of two water reservoirs at different elevations that can generate power as water moves down from one to the other (discharge), passing through a turbine. The system also requires power as it pumps water back into the upper reservoir (recharge).

How do hydraulic and pumped storage plants work?

To accommodate load changes that occur within the power system and to maintain constant speed, hydraulic and pumped storage plants rely on an assortment of devices. These control elements include movable gates and runners as well as a speed governor system that regulates the flow, power output, and speed to match the system demand.

What is a pumped hydro storage system?

A pumped hydro storage (PHS) system consists of the following parts: an upper reservoir, waterways, reversible (pump/generator) turbines or separated units of pumps and peltons, and a lower reservoir, as shown schematically in Fig. 1.

How does pumped storage hydropower work?

PSH acts similarly to a giant battery, because it can store power and then release it when needed. The Department of Energy's "Pumped Storage Hydropower" video explains how pumped storage works. The first known use cases of PSH were found in Italy and Switzerland in the 1890s, and PSH was first used in the United States in 1930.

What is pumped hydropower storage (PHS)?

Finally, it discusses the future of PHS technology, some remaining gaps in the field and potential research topics in this area. Pumped hydropower storage (PHS), also called pumped hydroelectricity storage, stores electricity in the form of water head for electricity supply/demand balancing.

What is a closed-loop pumped storage hydropower system?

With closed-loop PSH, reservoirs are not connected to an outside body of water. Open-loop pumped storage hydropower systems connect a reservoir to a naturally flowing water feature via a tunnel, using a turbine/pump and generator/motor to move water and create electricity.
