What is the difference between electrified and internal combustion engine vehicles?

Unlike electrified vehicles, internal combustion engine vehicles are not equipped with generator, electric motor and batteries of adequate power and capacity to allow the conversion of the vehicle kinetic energy into electric energy, as well as its storage and re-utilization for vehicle propulsion.

Should thermal energy storage systems be integrated with ICES?

These drawbacks could be overcome by integrating thermal energy storage (TES) systems with ICES. TES relies on sensible heat, latent heat and thermochemical storage. Latent heat storage method with phase change materials (PCMs) is the most utilized in ICES because of its good controllability and high storage capacity.

What are the energy losses of internal combustion engine?

Energy losses of internal combustion engine. In ICES, during the early periods of warm-up when the engine is cold, most of the heat released from fuel combustion is transferred to the cylinder. Moreover, HC and CO emissions are primarily released when engine temperature remains low during warming-up stage.
