

Where is energy stored?

Primary energy is predominantly stored chemically in oil or gas tanks, or in piles of specific energy carriers like biomass or coal. Secondary and final storage involves silos or piles of briquettes or biomass chips, or storage tanks for refined petroleum oils, fuels and gases.

What is secondary and final storage?

Secondary and final storage involves silos or piles of briquettes or biomass chips, or storage tanks for refined petroleum oils, fuels and gases. The conversion of these forms of energy into useful end-use energy including electricity provides for immediate energy services.

How can useful energy be stored?

Where is final energy stored?

Final energy in factories or households is often stored in tanks as chemical energy in the form of heating oil or natural gas. Thermo-physical energy in the form of steam, hot or cold water, or thermo-oils is also used.

Which form of energy is stored in a storable form?

The most common and stable form in which energy is stored is in its primary form. Most primary energy is usually obtained in storable forms. For example crude oil is stored in tank farms pending when they are sent to refineries for processing. Fig. 3 a shows the world's largest crude oil tank farm located in Cushing, Oklahoma, USA.
