This review highlights recent progress in the development of lithium-ion batteries, supercapacitors, and battery-supercapacitor hybrid devices.

What are lithium-based batteries?

Lithium-based batteries are a class of electrochemical energy storage devices. They are the subject of the article 'Understanding Li-based battery materials via electrochemical impedance spectroscopy' published in Nature Communications.

How are lithium batteries classified?

Lithium batteries can be classified by the anode material (lithium metal, intercalated lithium) and the electrolyte system (liquid, polymer). Rechargeable lithium-ion batteries (secondary cells) containing an intercalation negative electrode should not be confused with nonrechargeable lithium primary batteries (containing metallic lithium).

What is the potential of EIS in understanding battery charge storage?

Lithium-based batteries are a class of electrochemical energy storage devices where the potentiality of electrochemical impedance spectroscopy (EIS) for understanding the battery charge storage mechanisms is still to be fully exploited.

Are batteries rechargeable?

When talking about an EcES system, batteries are implicitly mentioned, which are electrochemical devices that convert chemical energy into electrical energy. On the other hand, batteries can be classified into two basic types: primary and secondary. The first one is not rechargeable, while the second one can be recharged.
