

How effective is silicon fuel?

Silicon Fuel has an effective hydrogen content of at least 9 wt%. Silicon Fuel has specific energy  $\geq 1.5$  kWh/kg with a 50% efficient fuel cell. For years it has been the aim of many to reduce the world's reliance on fossil fuels, with one of the key driving factors being their negative environmental impact [1].

Could silicon fuel be a "green" method of storing H<sub>2</sub>?

How does silicon fuel work?

Silicon and potassium hydroxide are ball milled together to produce a fine powder. The formulation, called 'Silicon Fuel', reacts with water to generate hydrogen gas. Yields of 70% or more are obtained within a few minutes without heating the mixture. Silicon Fuel has an effective hydrogen content of at least 9 wt%.

Can silicon and catalyst be Co-milled?

Here we demonstrate that silicon and catalyst can be co-milled to produce a formulation that has far greater potential than those made previously. The formulation, which we call Silicon Fuel, contains 90% silicon, giving a theoretical maximum specific energy of over 2.1 kWh/kg (assuming 50% fuel cell efficiency).
