Ammonia (NH 3) plays a vital role in global agricultural systems owing to its fertilizer usage is a prerequisite for all nitrogen mineral fertilizers and around 70 % of globally produced ammonia is utilized for fertilizers [1]; the remnant is employed in numerous industrial applications namely: chemical, energy storage, cleaning, steel industry and synthetic fibers [2].

As an energy storage medium, liquid ammonia (NH 3) actually packs in more hydrogen than liquid hydrogen (H 2) per same volume and the ammonia infrastructure is quite mature in China current industries. Therefore, in order to make it economically viable, motivative policies on encouraging the development of solar-based ammonia are expected in China.
