

Why do meteorites store phosphorus?

These storage molecules are all based on phosphorus. But early life needed meteorites to supply it in a useful form because terrestrial phosphorus would have been locked away in minerals. Today the most common energy store is adenosine triphosphate (ATP), used by millions of complex organisms.

Why did early life need meteorites?

Every organism has built-in batteries in the form of molecules that store energy from food until needed. These storage molecules are all based on phosphorus. But early life needed meteorites to supply it in a useful form because terrestrial phosphorus would have been locked away in minerals.

Is energy storage a transmission asset?

To date, no FERC order lays out a path for treating energy storage as a transmission asset. One of FERC-jurisdictional RTOs - Midcontinent Independent System Operator (MISO) - has sent a "storage as a transmission-only asset" proposal to FERC, which FERC did not reject but did not approve either.

Can energy storage be part of a transmission solution?

For energy storage to be part of the transmission solution, storage developers need to work with transmission owners and follow the Regional Transmission Organization (RTO) transmission planning protocols. Federal Energy Regulatory Commission (FERC) Order 841 mostly treats Electric Storage Resource (ESR) as a generation asset.

How can energy storage reduce the investment in power transmission & distribution equipment?

Therefore, energy storage can store the energy during the peak periods of the renewable energy outputs and release it during the uncongested periods, which can also reduce the investment for power transmission and distribution equipment.
