You must use an off-grid inverter capable of AC coupling and controlling the microinverters. GT inverters don't regulate themselves. They assume an infinite grid in which to dump whatever they can deliver. The grid source inverter must be capable of "frequency shifting" to instruct the GT inverters to reduce/stop output.

The "limiter" looks at the load and then tells the grid-tie inverter to reduce its output to equal the load. As they explain, the purpose of the "limiter" is to get around a smart meter (which charges you for power you export to the grid), by ...
