Is energy storage a new concept?

Energy storage is not a new concept for energy end-users or utilities. Aside from use of batteries for consumer electronics, utilities have been using batteries in the form of device-specific UPSs, facility wide UPSs, and even as part of emergency back-up systems, often in conjunction with on-site back-up generation.

What is energy stored in a field?

Energy stored in fields = the total energy required to assemble the fields. It takes energy to bring the charges to specific positions to assemble the field, and when you let everything go, the charges will just fly apart. The energy you stored in the field becomes the kinetic energy of the charges once you let them go.

What is an energy storage system (ESS)?

Energy Storage System (ESS) As defined by 2020 NEC 706.2, an ESS is "one or more components assembled together capable of storing energy and providing electrical energy into the premises wiring system or an electric power production and distribution network." These systems can be mechanical or chemical in nature.

The equation for the rotational kinetic energy is of the same form of the above except it is slightly different. It is: $E = \frac{1}{2} I \omega^2$ where I is the moment of Inertia given by $I = mr^2$ where m is the mass and r is the radius. ω is the angular velocity given by $\omega = v/r$ where v is the rotational velocity and r is the radius about which the object is rotating.. This is just a simplified explanation ...
