The energy supply includes a power source, storage unit (like a capacitor bank), and a welding transformer, which work together to provide the necessary current for the welding process. The energy storage allows for high instantaneous power levels, which are critical for effective spot welding.

The Stored Energy welding power supply - commonly called a Capacitive Discharge Welder or CD Welder - extracts energy from the power line over a period of time and stores it in welding capacitors. Thus, the effective weld energy is independent of line voltage fluctuations. This stored energy is rapidly discharged through a pulse transformer producing a ...
