

What is the density of crude oil?

At standard conditions, the density of crude oil ranges between 800 to 1000 kg/m³, depending on its composition. Oil density is often adjusted to a reference temperature, typically 15°C, to standardize measurements across different regions and industries. The density of oil can be calculated using the following formula: $\text{Density} = \text{Mass} \div \text{Volume}$

How do I calculate oil density?

Our Oil Density Calculator makes it simple to determine the density of oil for various conditions. Here's how you can use it: Enter the type of oil (e.g., crude oil, fuel oil). Input the temperature (in °C or °F). Specify the mass or volume if needed. The calculator provides the density in kg/m³, lb/ft³, or your preferred unit.

What is oil density lb/ft³?

Easy to use and accurate for kg/m³, lb/ft³, and more! Oil density is a measure of how much mass a specific volume of oil contains. It is influenced by factors such as the type of oil (crude, fuel, or lubricant) and temperature. At standard conditions, the density of crude oil ranges between 800 to 1000 kg/m³, depending on its composition.

How does temperature affect oil density?

As temperature increases, oil density decreases due to thermal expansion, and vice versa. Our Oil Density Calculator is a user-friendly tool designed to simplify the process of determining oil density under various conditions. Whether you're dealing with crude oil, fuel oil, or lubricants, this calculator provides accurate results in seconds.
