Can reducing energy improve the performance of automatic warehousing systems?

The author demonstrated that reducing energy consumption can improve the performance of automatic warehousing systems. Bortolini et al. proposed a bi-objective time and energy model for rack automatic warehouses, aiming to minimize both travel time and energy required by the cranes.

What are the main factors affecting energy consumption in warehouses?

Electric energy drives most warehouses, and its usage is regulated by design-related factors and control systems. Energy consumption in warehouses is mostly related to the operation of handling systems.

What is the warehouse energy consumption index?

The warehouse energy consumption index allows for a comparative analysis of energy consumption and the mechanization and automation of a warehouse. It is shown that a significant part of the energy is spent on maintaining a warehouse building, especially in the case of facilities with a low degree of automation.

Although there are several ways to classify the energy storage systems, based on storage duration or response time (Chen et al., 2009; Luo et al., 2015), the most common method in categorizing the ESS technologies identifies four main classes: mechanical, thermal, chemical, and electrical (Rahman et al., 2012; Yoon et al., 2018) as presented in Fig. 1.

This confirms the analysis in Section 3.1 that the PCM plays an important role in the cold energy storage during the nighttime and cold energy release during the daytime, making the refrigerator operate longer at night with higher COP and operate less in the daytime, and thus an amount of energy can be saved.

According to Burinskiene et al. [27], the main source of logistics-related CO₂ emissions is storage and material handling in warehouses, while, as noted by Sundarakani et al. [28], the earlier research had mostly focused on transportation aspects, often overlooking the importance of green practices, technologies, and regulatory measures within warehouse ...
