How to create a resonant cavity for EM waves?

One can create a resonant cavity for EM waves by taking a waveguide (of arbitrary shape) and closing/capping off the two open ends of the waveguide. Standing EM waves exist in (excited) resonant cavity (= linear superposition of two counter-propagating traveling EM waves of same frequency).

How do you calculate the total energy of a cavity resonator?

The total energy  $w$  [J] =  $w_e(t) + w_m(t)$  in each mode  $m, n, p$  of a cavity resonator can be calculated using (2.7.28) and (2.7.29), and will decay exponentially at a rate that depends on total power dissipation  $P_d$  [W] due to losses in the walls and in any insulator filling the cavity interior:
