What are the components of an air conditioning system?

A typical air conditioner consists of four main components: the evaporator coil, the compressor, the condenser coil, and the expansion valve. Every part of your central air conditioner contributes in a different way to the comfort of cooling your home.

What is an air conditioning system?

Aircon, AC, and A/C are common terms for air conditioning, which is a system that includes a fan to circulate conditioned air within an enclosed area, such as a building or a vehicle.

What are air conditioning systems used for in museums?

Air conditioning systems are used in museums to maintain a suitable environment for fragile items like artwork. The cooling and dehumidification of spaces with heat-generating electronics, such as computer servers and power amplifiers, is another use for air conditioning systems.

What are the parts of a commercial air conditioner?

A commercial air conditioner consists of several main parts. The compressor is the system's engine, converting low-pressure gas into high-pressure gas with a high temperature. Other key parts include the condenser, expansion valve, and evaporator.

What is thermal energy storage for space cooling?

Thermal Energy Storage (TES) for space cooling, also known as cool storage, chill storage, or cool thermal storage, is a cost saving technique for allowing energy-intensive, electrically driven cooling equipment to be predominantly operated during off-peak hours when electricity rates are lower.
