Turn-on, turn-off, and storage delay The Bipolar transistor exhibits a few delay characteristics when turning on and off. Most transistors, and especially power transistors, exhibit long base-storage times that limit maximum frequency of operation in switching applications. One method for reducing this storage time is by using a Baker clamp.

Besides, time-series data is already indexed in time order. Based on these characteristics, tstorage adopts a linear data model structure that partitions data points by time, totally different from the B-trees or LSM trees
