Do cyclic storage and release of elastic energy reduce work demands?

Cyclical storage and release of elastic energy may reduce work demands not only during stance, when muscle does external work to supply energy to the center-of-mass, but also during swing, when muscle does internal work to reposition limbs.

Does elastic energy storage affect movement across vertebrates and invertebrates?

We examine evidence for elastic energy storage and associated changes in the efficiency of movement across vertebrates and invertebrates, and hence across a large range of body sizes and diversity of spring materials. potential (E_{gp}) energy, respectively. . Any change in energy requires work. This work is typically done by muscle.

Can wearable devices with human body lower limbs scavenge kinetic energy?

To adaptably fit the wearable devices with human body lower limbs to scavenge kinetic energy and monitor all kinds of human motion, an MC-EH-HL system with energy harvesting and sensing functionalities is developed by integrating S-PEG and R-TENG, as shown in Figure 1b.

Is there a solution for lower-limb motion monitoring?

Lower-limb motion monitoring is highly desired in various application scenarios ranging from rehabilitation to sports training. However, there still lacks a cost-effective, energy-saving, and computational complexity-reducing solution for this specific demand.

How is lower-limb motion captured in Arduino Nano?

Lower-limb motions are captured and transferred by different channels of R-TENGs into electrical data and then separately acquired by Arduino Nano. Afterward, Arduino delivers the signals to the RF modules: the transmitting terminal A and the receiving terminal B.
