What is a server water cooled system?

Fig. 1 (a) shows the system flowchart. A server water-cooled system, including a cabinet, fin-type water-cooled heat sinks, two pumps, plate heat exchanger, and cooling tower, with a total load of 4.8 kW. The server cabinet contained 12 chips, with a thermal power of 400 W for each chip.

How does a server cooling water transfer heat?

The heat carried by the server cooling water is released to the cooling tower water in the heat exchanger first, and finally to the atmospheric environment. Therefore, more attention should be paid to the cooling-tower water mass flow rate and atmospheric conditions.

Can water-cooled heat sinks reduce energy consumption of data center?

It was found that for a 350 kW water cooling system and a 50 kW air cooling system, the discounted payback period (DPB) was as low as 285 days.

How does humidity affect server water cooled systems?

From this, the optimal cooling water flow rates, optimal server inlet temperature, and minimum total energy consumption of the server water-cooled system showed a nearly linear increase with increasing atmospheric relative humidity for both A- and B-types, which was determined by the cooling tower characteristics.
