Are lithium-ion batteries a good energy storage device?

Lithium-ion batteries are currently the most widely used energy storage devices due to their superior energy density, long lifespan, and high efficiency. However, the manufacturing defects, caused by production flaws and raw material impurities can accelerate battery degradation.

Why do batteries catch fire when not in use?

In some extreme cases, batteries may catch fire spontaneously when not in use, often due to defects in their manufacturing process. For example, an electric vehicle got self-ignited without traffic accident in 2018, Hubei, China. These defects can accelerate performance deterioration, shorten battery lifespan and compromise battery safety.

The key is whether we feel comfortable with the probability of failure. Let us make a simple calculation. Assume that the self-induced failure rate at the vehicle level is calculated by $p = 1 - (1 - P)^m$, where P is the failure rate for m electric vehicles, each of which has a battery pack containing n cells. 1 Taking the Tesla Model S as an example, $n = 7,104$.
