An electric car"s production process leads to significantly increased energy demand and greenhouse gas emissions than in the case of an internal combustion (IC) vehicle, although it has a significantly lower overall

•••

Yet even with this optional extra, the time to refuel is around 6 times greater than that of an internal combustion engine counterpart in the same small car class. The ideal electric energy storage needs to hold enough energy to have acceptable range, but also be able to handle the power levels associated with quick charging.

Energy storage systems (ESS) are highly attractive in enhancing the energy efficiency besides the integration of several renewable energy sources into electricity systems. While choosing an energy storage device, the most significant parameters under consideration are specific energy, power, lifetime, dependability and protection [1].

A battery is needed to provide longer duration energy storage capacity while a supercapacitor is needed to respond to rapid power fluctuations in the system. The answer to batteries or supercapacitors, is often times both. ...
