What is the difference between PCS and energy storage inverter?

Next, let's look at the differences between PCS and energy storage inverter. The Power Conditioning System (PCS) is the core module in electrochemical energy storage. It is mainly used to store electrical energy from the grid into energy storage devices such as batteries and release it to the load when needed.

How does an inverter function?

An inverter takes DC power from a battery pack or other source, regulates and controls it, and converts it into AC power for use on the power grid. Unlike a PCS, an inverter's primary function is to switch DC to AC.

How does a solar inverter work?

They offer high stability. During peak electricity usage, the inverter converts solar DC into AC and feeds it into the grid; during off-peak times, it converts grid AC into DC for storage, allowing for bidirectional conversion and robust power support during outages.
