Self-discharge (SD) is a spontaneous loss of energy from a charged storage device without connecting to the external circuit. This inbuilt energy loss, due to the flow of charge driven by the pseudo force, is on account of various self-discharging mechanisms that shift the storage system from a higher-charged free energy state to a lower free state (Fig. 1 a) [32], [33], [34].

The converse impact of technology on science is of at least equal importance: (1) through providing a fertile source of novel scientific questions and thereby also helping to justify the allocation of resources needed to address these questions in an efficient and timely manner, extending the agenda of science; (2) as a source of otherwise unavailable instrumentation and ...
