Is a capacitor more efficient than an inductor?

For the same occupancy /volume,a capacitor is a much more efficientenergy storage component compared to an inductor. By an order of two magnitudes roughly. Also,for the same occupancy /volume,a capacitor can store more energy than an inductor. But,you could also factor in the method of putting energy into the capacitor or inductor.

Why do we use inductors over capacitors?

We opt for inductors over capacitors because inductors hold energy within a fieldwhereas capacitors store energy in a field. Depending on the circuit's needs,like energy storage,filtering or impedance matching an inductor might be a choice,than a capacitor. What is the difference between resistor capacitor and inductor?

They have different applications and characteristics,such as energy storage,filtering,and impedance matching.

What is the difference between capacitor and inductance?

Capacitance and inductance are both properties of electronic components,but they work in different ways: Capacitanceis the ability of a capacitor to store electrical energy by holding charges between two plates separated by a dielectric material.

What happens if you store energy in a capacitor?

But,if you store energy in a capacitor from a ramping voltage source (for instance a constant current source),the energy lost is near-enough zero. And,if you tried to store energy in an inductor using a current source,you would lose half the energy (and be faced with a massive voltage spike).

Can you store energy in a capacitor from a voltage source?

On the other hand,if you chose to store energy in an inductor from a voltage source,then you would do so much more efficiently. But,if you store energy in a capacitor from a ramping voltage source (for instance a constant current source),the energy lost is near-enough zero.
