What is the energy storage capability of electromagnets?

The energy storage capability of electromagnets can be much greater than that of capacitors of comparable size. Especially interesting is the possibility of the use of superconductor alloys to carry current in such devices. But before that is discussed, it is necessary to consider the basic aspects of energy storage in magnetic systems.

Can energy be stored in a magnetic field?

Textbooks say that in a capacitor or inductor, energy is stored in an electric or magnetic field. How can energy be stored in a field? Mathematically it can be proved but I am not able to feel what it means physically.

What is energy stored in a field?

Energy stored in fields = the total energy required to assemble the fields. It takes energy to bring the charges to specific positions to assemble the field, and when you let everything go, the charges will just fly apart. The energy you stored in the field becomes the kinetic energy of the charges once you let them go.

Does an electromagnetic wave have energy?

You have learnt that an electromagnetic wave comprises an electric field and a magnetic field oscillating mutually at right angles to one another. Being a wave it carries energy and so an electromagnetic wave must have energy associated with it. Where is that energy stored?

What is an electromagnetic field?

An electromagnetic field (EMF) is caused by electrically charged objects and influences the behavior of materials or charged particles around it. The total amount of energy of the field and the materials it affects is called electromagnetic field energy.

What is affected by an electromagnetic field?

Electromagnetic field is caused by electrically charged objects, that influences the behavior of materials or charged particles around the field. The total amount of energy of the field and the materials it affects is called electromagnetic field energy.

The point is, you shouldn't think of the electrostatic energy being contained in the charged particles. You should think of it as being contained in the field also. Otherwise it gets hard to understand how the electric field from some particles in the sun, that's been traveling for 8 minutes (and thus the original particles have likely changed configuration ...
