How can ocean energy contribute to a blue economy?

Energy harnessed from the oceans, through offshore renewables, can contribute to the decarbonisation of the power sector and to other end-use applications that are relevant for a blue economy (for example, shipping, cooling and water desalination).

What makes marine energy resources suitable for the Blue Economy?

Marine energy resources, including ocean waves, tides, currents, and salinity and temperature gradients, are particularly well suited to address these power constraints in the blue economy because they are renewable, geographically co-located, and complementary to other energy sources.

Are marine energy technologies enabling Blue Economy expansion?

Marine energy technologies hold promise as an enabler of blue economy expansion. The U.S. power sector is rapidly evolving to include new and diverse forms of energy, with marine energy being one of the promising sources. WPTO's Marine Energy e-newsletter shares news and updates on tools, analysis, and emerging technologies to advance marine energy.

How can we make a blue economy more sustainable?

To create a more sustainable blue economy, we must address and remove energy constraints. The Powering the Blue Economy (PBE) initiative aims to leverage the power of the ocean for sustainable economic development through its broad portfolio of projects.

What is the Blue Economy?

The Blue Economy refers to the sustainable use of ocean resources for economic growth, improved livelihoods, and jobs while preserving the health of ocean ecosystems. Marine energy technologies hold promise as part of the national energy mix and as an enabler of blue economy expansion.

What is Powering the Blue Economy (PBE)?

The Powering the Blue Economy (PBE) initiative, launched by WPTO in 2019, aims to explore the potential applications of marine energy technologies beyond the grid. This initiative has engaged a large community of stakeholders around a common goal.

green and blue hydrogen deployment, for example economies of scale in hydrogen use or hydrogen logistics. A hydrogen-based energy transition will not happen overnight. Hydrogen will likely trail other strategies such as electrification of end-use sectors, and its use will target specific applications. The

This study focuses specifically on the types of mechanisms (if any) for economic benefit-sharing applied at operational sites of two emerging ocean sectors in many Blue Economy plans: blue carbon and marine renewable energy (Cisneros-Montemayor et al., 2019). Both sectors are relatively recent--e.g., compared to

According to the NITI Ayog, India will have a battery storage potential of 600 gigawatt hour (GWh) by 2030, and demand for electric vehicles, stationary storage and consumer electronics will mainly drive the adoption of ...

Energy harnessed from the oceans, through offshore renewables, can contribute to the decarbonisation of the power sector and to other end-use applications that are relevant for a ...

Marine renewable energy includes both offshore wind energy and ocean energy, two green energy resources that are key to the EU's ambitions to decarbonize its energy sector.. The most ...

"Safeguarding the Planet" is one of the key themes that covers energy, climate and nature at the World Economic Forum's Annual Meeting in Davos from 20-24 January. ... The ...

The company's Blue Star wave energy converter was designed specifically for subsea applications in oil and gas and CCS. It generates renewable energy from ocean waves and offshore solar, storing it in advanced ...

Other promising sectors include ocean energy and "blue" biotechnology, while desalination is becoming more important on account of growing fresh water shortages in dry regions. ... observed in the blue energy sectors, where the EU is a global leader in both offshore wind and ocean energy. On the other hand, the EU is lagging behind in aquac ...

Overall, energy storage systems can be deployed on the floating offshore platforms or on the seabed. In summary, there are several advantages of floating energy storage. First, energy storage devices can take advantage of space on the decks of floating wind turbines in mode 3 of decentralized offshore electrolysis.

There are two major concerns in this process: clean energy supply and the energy storage system. The development of marine clean energy technologies is at an early stage ( Marine& Offshore, 2021 ). Fixed offshore wind is a mature technology while floating wind solutions are reaching commercial viability.

The ocean energy sector has made great progress towards commercialisation in 2023. The UK and French governments have played pivotal roles, contracting a combined 70 MW of tidal stream capacity. This brings publicly supported tidal additions in the 5 next years to 127 MW. This significant leap

IRENA also released an Innovation Outlook on Thermal Energy Storage, further supporting advancements in this critical area. A strong outlook for 2025 . In summary, the energy storage market in 2025 will be shaped by technological advancements, cost reductions, and strong government policy.

environment and delivering on decarbonization goals, hinges on the development of innovative, reliable, and clean energy solutions.

Ocean Energy in Islands and Remote Coastal Areas Potential challenges to the adoption of ocean energy technologies in these markets have been identified and include: socio-environmental issues such as misinformation and social acceptance, regulatory and political barriers due to the relatively nascent nature of the ocean energy sector where support ...

The global energy landscape is undergoing a profound transformation, marked by the interplay of factors that span the near and long term. This evolution is intrinsically linked to the era of ...

Advancements in energy storage systems and the integration of renewable energy grids offer exciting possibilities for the future. This article has explored the economic potential of ocean energy and the importance of ...

Marine energy is both reliable and forecastable; in the case of tidal or ocean currents, they are predictable years in advance. This predictability lends itself to appropriately sized storage systems and researchers are currently ...

Europe has emerged as a hub but the US and China are increasing investments into ocean energy technology. ... Europe has become a hub for wave and tidal energy, leading both on development and deployment and testing, with EUR78m (\$82m) of the Horizon Europe 2023-24 funding allocated to pilot farm demonstrations. ... The wave energy sector ...

Energy storage systems play a vital role in ocean energy by capturing and storing excess energy during periods of low demand and releasing it during high demand periods. These systems ensure a smooth power supply, ...

Whether organisations operate in the private sector, the public sector, or the non-profit sector and whether they are based in America, Europe or Asia, there is a growing challenge to rethink the strategies driving our ...

As the world shifts toward a more sustainable energy future, two essential innovations are emerging as key drivers of the energy transition: energy storage solutions and next-generation fuel technologies. Energy storage plays ...

In modern times, energy storage has become recognized as an essential part of the current energy supply chain. The primary rationales for this include the simple fact that it has the potential to improve grid stability, improve the adoption of renewable energy resources, enhance energy system productivity, reducing the use of fossil fuels, and decrease the ...

The clean tech company deployed its prototypes to Ocean Batteries, which will work with Hillcrest to integrate the inverters into its onshore energy storage systems; Given the rapid transition towards electrification, a growing demand exists for energy storage solutions; Hillcrest Energy Technologies last traded at \$0.24 per share

Additionally, the growth of the ocean energy sector can stimulate local economies, attract investments, and create new revenue streams. Successful examples include countries like Denmark and Scotland, which ...

The Blue Economy has been gaining significant traction over recent years and is projected to reach a market size of \$3 trillion by 2030, according to the OECD (Organisation for Economic Co-operation and Development). A catch-all term that encompasses industries and activities related to the ocean, seas, and coastal waters, the Blue Economy spans a wide array ...

By removing and addressing energy constraints in the blue economy, we can strengthen existing--as well as create new--applications for sustainable economic development. Through its broad portfolio of projects, the ...

The blue economy refers to the sustainable utilization of ocean and coastal resources for economic growth, improved livelihoods, and job creation while preserving the health of marine ecosystems.

The different sectors of the Blue Economy will be significantly impacted. Conclusion. Blue Economy can be seen as a policy, a project, a framework, a system and an idea. It has the potential to become one of the ...

Offshore oil and gas (O& G) production represents 25% of the blue economy market, with the possibility of expansion (Choudhary et al. 2021). Recent new oil and gas fields found in coastal areas of developing countries, including deep-water exploration in South America and Africa (de Sant'Anna Pizarro and Branco 2012; da Costa Fraga et al. 2015) and ...
