How does a battery cooling system work?

In some novel battery systems, the liquid cooling system has been integrated into the battery pack or battery module. The inlet/outlet aluminum tubes, pack side plates, and cooling plates are integrated as a liquid cooling system. The coolant flows in from the inlet, passes through the cooling plates, and finally flows out through the outlet.

Why is a battery cooling system needed?

Generally, the liquid cooling system is needed to maintain the battery temperature below 45°C. The electrochemical reaction and self-discharge of the battery during the charging, discharging, and stationary state are affected by the battery temperature.
